Environmental Ground Roll

bank stabilisation and ground protection

The **Environmental Ground Roll** is a unique new concept using traditional technology. Woven from native species of willow grown on the Somerset Levels and manufactured using 100% natural materials. Ground Rolls have many uses, from reusable ground protection whilst accessing wet areas, to bank stabilisation projects. They can be left to become incorporated into the river bank and protect the river from additional erosion, greatly increasing the investment value and longevity of the work carried out.

Perfect for vehicular or pedestrian use. Ground Rolls can be made in steamed (brown) willow, green living willow or a combination of both.

Easy to handle ...

The compact rolls can be easily transported to site and are available in rolls or as a ‘Work Mat’

Ground Rolls can be made to any size, with or without integrated, natural sisal rope handles

Easy to handle - simply roll out by hand, and roll back onto a trailer with a tail ramp.

Provides impressive ground protection and allows access to areas otherwise difficult to reach

Ground Rolls provide fantastic surface protection - illustrated here with and without the ground roll

When the project is complete the roll can be moved to a new site, leaving the ground in excellent condition

Attractive, effective and environmentally friendly. Ground Rolls are perfect for river bank stabilisation projects, and because they are 100% natural and bio-degradable, they can be left to blend with the vegetation and become part of the surroundings. All the willow used in the manufacture of Ground Rolls is grown on our own withy beds, to our exacting standards, allowing us to manage the entire process from start to finish.

We offer a supply-only service, with the rolls or panels delivered direct to site, or a complete supply and installation service. Our experienced craftsmen are able to assess your project and tailer the ground roll to your particular situation.
